Swiggy Clone Web Application – Case Study Report

1. Introduction

The Swiggy Clone project is a front-end web application designed to replicate the basic functionality of a food delivery platform similar to Swiggy. The objective of this project is to understand how real-world e-commerce and food delivery platforms work, including product listing, searching, filtering, and sorting.

This project is built using **HTML, CSS, and JavaScript**, focusing on user interaction and dynamic content rendering without using any backend technology.

---

2. Objectives

- To design a user-friendly food ordering interface
- To implement search functionality for food items
- To apply filters based on category and rating
- To implement sorting based on delivery time
- To understand DOM manipulation using JavaScript

CASE STUDY

3. Technologies Used

- **HTML** – Structure of the web page
- **CSS** – Styling and layout design
- **JavaScript** – Logic, filtering, and dynamic updates

---

4. System Design

4.1 User Interface

The interface is divided into two main sections:

- **Sidebar**
  - Search bar
  - Category filter (Pizza, Burger, Drinks)
  - Rating filter
  - Sorting options
- **Main Content Area**
  - Displays food items in card format
  - Each card includes image, name, rating, and delivery time

---

4.2 Data Structure

Food items are stored in an array of objects:

- Name of food item
- Category
- Rating
- Delivery time
- Image URL

---

5. Working of the System

Step 1: Display Food Items

- All food items are displayed when the page loads
- A function dynamically creates cards using JavaScript

CASE STUDY

Step 2: Search Functionality

- Users can type in the search box
- The system filters food items using string matching

Step 3: Category Filter

- Users can select a category
- Only matching items are displayed

Step 4: Rating Filter

- Filters items based on minimum rating

Step 5: Sorting

- Users can sort items based on delivery time:
    - Fast delivery
    - Slow delivery

---

6. Features

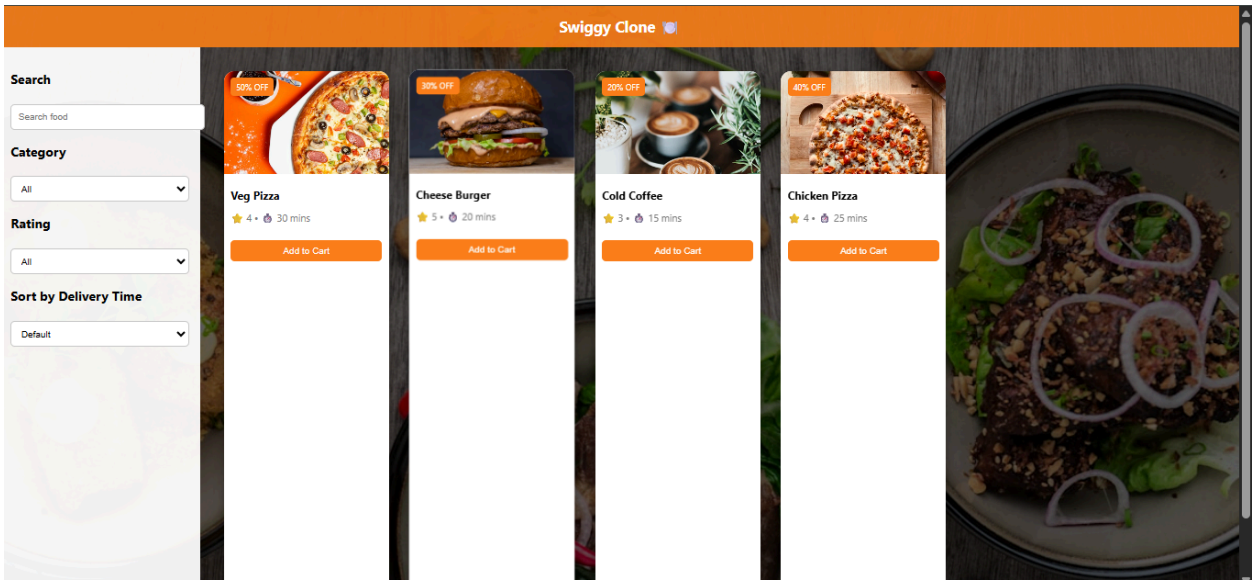
- Dynamic product rendering
- Real-time filtering and searching
- Responsive card layout
- Interactive UI with hover effects

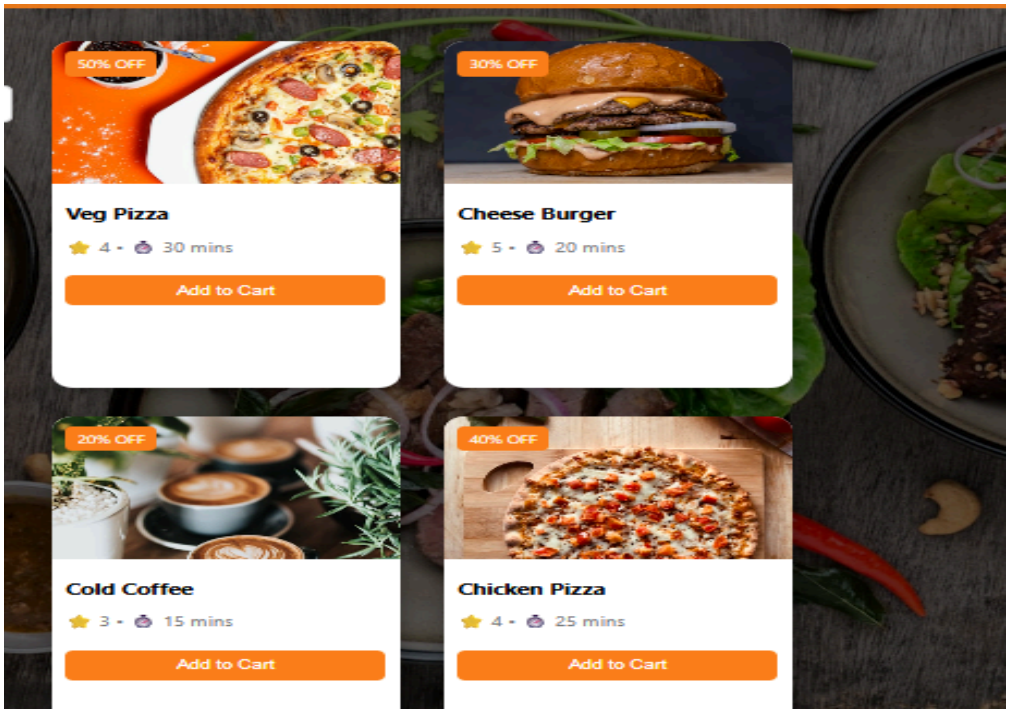
---

7. Advantages

- Simple and easy to use interface
- Fast performance (no backend required)
- Helps in understanding JavaScript concepts
- Can be extended into a full-stack project

CASE STUDY

10. Conclusion




The Swiggy Clone project successfully demonstrates the basic working of a food delivery platform. It helps in understanding how filtering, searching, and sorting are implemented in real-world applications. This project serves as a strong foundation for developing more advanced full-stack applications.
